Description:

From the Publisher An introduction to those aspects of computer hardware and architecture that affect programming. --This text refers to an out of print or unavailable edition of this title.

From the Back Cover This book takes a modern structured, layered approach to understanding computer systems. It's highly accessible - and it's been thoroughly updated to reflect today's most critical new technologies, including Pentium II and UltraSPARC microprocessors, Windows NT and Java Virtual Machines. Tanenbaum and Goodman present a computer as a series of layers, each one built upon the ones below it, and understandable as a separate entity. The book includes detailed coverage at the digital logic and micro-architecture levels, instruction set level, and operating system machine level, and contains a completely rewritten and updated chapter on parallel computer architecture. This new edition includes a wealth of new material about modern I/O devices, a detailed discussion of the Java Virtual Machine (including a microprogrammed implementation of a subset of a JVM), extensive coverage of multiprocessing, and much more. For all computer professionals and engineers who need an overview or introduction to computer architecture. --This text refers to an out of print or unavailable edition of this title.
